1 2

## What is claimed is:

	7.	A method for use in a system having a network, comprising:	
		receiving a control message for a call session over the network;	
		receiving one or more predetermined criteria entered by a user;	
		comparing information in the control message against the one or more	
predetermined criteria; and			
		launching a software routine based on the comparison of information	
	in the control message with the one or more predetermined criteria		

- 2. The method of claim 1, wherein launching the software routine includes launching a software routine that is separate from routines associated with call control, call status, and media-related tasks.
- 3. The method of claim 1, wherein launching the software routine includes launching a software routine to perform a service in addition to call control and status and media-related tasks.
- 4. The method of claim 1, further comprising sending one or more messages in response to the control message to establish a call session.
- 5. The method of claim 1, wherein receiving the control message includes receiving a message according to a predetermined protocol for establishing a real-time audio-based interactive communications session.
- 6. The method of claim 1, wherein receiving the control message includes receiving a message for establishing a real-time text-based communications session.
- 7. The method of claim 1, wherein receiving the control message includes receiving a message according to a Session Initiation Protocol.
- 8. The method of claim 1, further comprising receiving the one or more predetermined criteria from a user interface.

routine.

- 9. The method of claim 8, further comprising receiving a name of the software routine to be launched from the user interface.

  1 10. The method of claim 9, further comprising receiving user-defined data from the user interface, the user-defined data for passing to the launched software
- 1 11. The method of claim 1, wherein receiving the control message is 2 performed by a protocol-aware module and comparing the information is performed 3 by a separate module.
  - 12. The method of claim 1, wherein comparing the information in the control message includes comparing an identifier of a caller.
    - 13. The method of claim 1, wherein comparing the information in the control message includes comparing an identifier of a callee.
    - 14. The method of claim 1, wherein comparing the information in the control message includes comparing information selected from the group consisting of time, date, message subject, message priority, message direction, caller identifier, and callee identifier.
    - 15. The method of claim 1, further comprising launching different ones of plural routines based on the comparison of the control message information with the one or more predetermined criteria.
  - 16. The method of claim 1, wherein receiving the control message includes receiving a Session Initiation Protocol Invite request.

		10	
1	\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\	A system comprising:	
2	,	a processor;	
3		an interface to receive a call request over a network;	
4		a protocol-aware module executable on the processor to process the	
5	call request; and		
6		a rules processing module executable on the processor to compare	
7	information i	n the call request with a set of one or more user-defined rules.	
1	18.	The system of claim 17, further comprising a routine, wherein the rules	
2	processing module is executable on the processor to launch the routine based on the		
3	comparison.		
1	19.	The system of claim 18, wherein the routine performs a task that is in	
2	addition to ca	all control, call status, and media-related services.	
1	20.	The system of claim 18, wherein the routine includes a web browser.	
1	21.	The system of claim 18, further comprising a user interface to receive a	
2	name of the r	outine.	
1	22.	The system of claim 21, wherein the user interface is further capable of	

23. The system of claim 17, further comprising a user interface to receive

receiving user-defined data to pass with the launching of the routine.

- 1 24. The system of claim 17, wherein the call request includes a Session
- 2 Initiation Protocol Invite request.

the one or more user-defined rules.

1	25.	An article including one or more storage media containing instructions	
2	for controlling a device in a communications system having a network, the		
3	instructions when executed causing the device to:		
4		receive a message according to a predetermined protocol;	
5		compare information in the message with one or more predetermined	
6	user-defined	rules; and;	
7		launch a software routine unaware of the predetermined protocol.	
1	26.	The article of claim 25, wherein the predetermined protocol provides	
2	for real-time	interactive communications sessions.	
1	27.	The article of claim 25, wherein the predetermined protocol provides	
2	for text-based	d chat sessions.	
1	28.	The article of claim 25, wherein the predetermined protocol includes a	
2	Session Initia	ation Protocol.	
1	26.	A data signal embodied in a carrier wave and comprising instructions	
2	for controllin	g a device in a communications system, the instructions when executed	
3	causing the device to:		
4		receive a call request according to a first protocol;	
5		perform a rules check of information in the call request; and	
6		launch one of plural tasks based on the rules check.	
1	30.	A system comprising:	
2		a plurality of software routines;	
3		a storage device containing user-entered rules including a first set of	
4	rules and a second set of rules; and		
5		a controller adapted to launch a first software routine if the first set of	
6	rules is satisf	ied and to launch a second software routine if the second set of rules is	
7	satisfied.
